Customer Problem Statement

The Customer Problem Statement helps identify the user's needs, challenges and expectations. Understanding the customer's point of view enables the development of an AI-powered solution that accurately detects a learner's emotional state from their written messages and delivers empathetic, actionable guidance in response.

Problem Statement	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A student engaging with an AI tutor or learning platform while studying a difficult topic.	Get help and feedback that matches how I'm actually feeling about the material.	The AI tutor gives the same generic response whether I'm confused, anxious, or confident.	Existing AI tutors have no way to detect emotional context from what I type.	Unsupported, more frustrated, and less motivated to keep trying.
PS-2	An educator or teaching assistant supporting students in a digital or hybrid classroom.	Understand how my students are feeling about the material so I can step in at the right time.	I have no visibility into emotional signals across an asynchronous or large group of students.	There is no automated tool that analyzes student messages and surfaces emotional trends to instructors.	Disconnected from my students and unsure where to focus my attention.
PS-3	An ed-tech program coordinator overseeing an online course or bootcamp cohort.	Monitor overall learner engagement and wellbeing across the cohort to reduce drop-off.	Existing analytics dashboards only track completion rates and quiz scores.	Emotional and sentiment signals from learner interactions are never captured or aggregated anywhere.	Blind to early warning signs of disengagement until it is too late to intervene.
